Sierra Leone

Sierra Leone is located in the West African coast, bounded on the west by the Atlantic Ocean, on the north and east by Guinea and on the southwest by Liberia. Population movement across these borders is very high. Similarly the 3 countries have recent histories of insecurity and civil strife. Inter-country collaboration is carried out through the Mano River Union (MRU) as well as the economic community of West African States (ECOWAS). Sierra Leone has a surface area of 71,740 square kilometres. This tropical country averages an annual rainfall of 3,150 mm and the vegetation ranges from mangrove along the coast to forest covered hills and savannah further inland. The population of Sierra Leone is estimated at 5.4 million for 2008. About two-thirds of the population live in rural areas while a third lives in urban areas, mainly in the capital city of Freetown. Sierra Leone gained independence from Britain on the 27th of April 1961. The mainstay of Sierra Leone's economy is the agricultural sector with about 55% engaged in subsistence farming, industry, 25% and services 20%.

HEALTH & DEVELOPMENT

1. Economic and Social development

Based on the 2007 Human Development Report, Sierra Leone with a ranking of 177 out of 177 continues to be the least developed country in the world. This is corroborated by the fact that Sierra Leone is ranked 102 out of 108 in the Human Poverty Report with Human Poverty Index (HPI) of 51.7. Progress has however been made especially in creating enabling environment for socio-economic development. The economy witnessed an overall impressive performance in 2006 with real GDP growth estimated at 7.8% as against 7.3% in 2005.

2. Health profile

Life expectancy at birth in Sierra Leone is estimated at 47.5 years. Low life expectancy rate in Sierra Leone is associated with heavy disease burden and high child and maternal morbidity and mortality. The underlying factors are pervasive poverty, high level of illiteracy especially among females, limited access to safe drinking water and adequate sanitation, poor feeding and hygienic practices, and overcrowded housing and limited access to quality health services.

**Disease Burden:** Malaria accounts for about 48% of out patient attendances, accounting to about 25% mortality in children and under-fives. The strategic direction for malaria control is vector control and, prevention of malaria, prevention of malaria-in-pregnancy and heath promotion. Significant are Acute Respiratory Illnesses (ARI), 27%, STI and Diarrhoea. HIV/AIDS prevalence is becoming a threat. The national sero-prevalence as at 2005 is estimated as 1.53%. For TB the number ofDOTS centre has increased to 80 nationwide and the case detection rate rose from 42% in 2004 to only 52.1% in 2007. Lassa Fever control scaled up. Mass drug administration pursued in control of Onchocerciasis. Hypertension, diabetes and mental illnesses are increasing with drastic changes in lifestyle and drug abuse.

**Child and Maternal Morbidity and Mortality:** Data shows that Sierra Leone has the highest under-five mortality rate in the world, with almost one out of three dying before the reaching the age of five. Main causes are Malaria, Diarrhoea and Pneumonia. Neonatal mortality account for 20% of all US mortality. Malnutrition plays an important part in US mortality. Sierra Leone is ranked as having the one of the highest rates of maternal mortality in the world. The main causes are obstructed labour, haemorrhage, anaemia and toxaemia in pregnancy.

3. Health systems

(a) Functional health facilities - There is inequitable distribution of service delivery points, rural areas suffering neglect; Challenges faced in supply of drugs and medicines, blood transfusion services, equipment supply and laboratory services (b) Human resources for health – Severe shortfall exists in the public services in 2006; Of 300 medical officer required, 78 are available; 600 nurses required, 315 available; 300 midwives required. (c) Administration and management of the health care delivery system – There is ongoing sector reform, in 2005, all primary health care (PHC) activities were devolved to local councils. As a result, government allocations for PHC are directly allocated to district councils through the Ministry of Local Government. The local councils in turn fund health activities proposed by the DHMT. (d) Health care financing - about 69.3% of the total health expenditure in Sierra Leone is out-of-pockets spending, 19.3% from the public sector and 0.4% from the private sector. The challenge here is to adopt a health sector financing policy and strategy that will be both equitable and pro-poor.

**OPPORTUNITIES**

- Specific investments to improve the immunization system to include EPI desk review; data quality audit; RED approach
- Guinea Worm free certification
- National health policy in place
- Decentralization and restructuring of health service
- Availability health sector policy
- Donor focus and funding on reproductive, maternal and child health
- Soon will be available Demographic Health Survey results

**CHALLENGES**

- Weak referral system between PHUs, secondary and tertiary health care levels.
- Unavailability of comprehensive health system financing policy and health system financing strategic plan with a roadmap
- Scale up to full immunization coverage
- Administration of and management of healthcare delivery system
- Health care financing
- Scaling up of HIV/AIDS
- Finalization of policies, legislation, and strategic plan in health sector
- Development of operational plans, guidelines and tools to improve service delivery
- Improving health information data collection and management

PARTNERS

In addition to WHO, main partners working in health include: UN Agencies (UNICEF, UNFPA, UNDP, FAO, and WFP), the World Bank, EU, DFID, Irish Aid and the ADB. The interventions in the health sector by UN Agencies are undertaken on an individual and/or collaborative basis within the framework of the UNDAF. Bilateral partners include the EU, ABB and DFID.

Since 1996 the health sector was primed to move towards a sector-wide approach for health delivery. Currently the MOHS has developed a sector programme with a three-year rolling plan.

The main mechanisms for coordination in the health sector are:

Health Sector Coordinating Committee (HSCC): Membership is drawn from Ministers of relevant line-ministries, heads of donor and key developmental partners, and country representatives of WHO, UNICEF, UNFPA AND UNAIDS. The core-function of the committee is to advice and endorse health policy and strategic issues, coordinate macro level inputs to increase resource harmonization and promote alignment with national health policy and strategic plans, mobilize health resources and build effective, transparent and accountable financial and technical partnership;

Inter Agency Coordinating Committee for Reproductive and Child Health (ICC-RCH): The committee oversees the planning, resource mobilization, and partnership for Reproductive and Child Health activities;

Country Coordination Mechanism (CCM): CCM oversees the implementation of projects financed through the GFATM and meets quarterly;

Health Implementing Partners Coordinating Committee: Membership is drawn from Directors and programme managers of the Ministry of Health, technical officers of relevant UN agencies, International and local NGOs. Faith based organizations, civil society, red cross and red crescent movements, health project coordinators from bilateral & donor organization, health professionals from medical schools etc. and its main functions is to discuss general health strategic and implementation issues, which critical policy issues will be presented to the HSCC for endorsement.

Development Partnership Aid Coordination Committee (DEPAC)--It is constituted of government ministers, bilateral, multi-lateral partners, and UN Agencies.

It is established to monitor the flow of donor assistance and the implementation of agreed projects, including health.

WHO STRATEGIC AGENDA (2008-2011)

The CCS is an articulation of WHO corporate strategy at the country level. The objective is to assist Sierra Leone in the attainment of the best possible level of health. The following are the programmatic areas:

1) **Health Security**: Reduce the health, social and economic burden of communicable and non communicable diseases; reduce, infant, child and maternal mortality and morbidity; and promote responsible and healthy sexual and reproductive health behavior; the PHC Declaration, IHR and Health and Environment

2) **Health System capacities and performance**: Strengthen health policies, systems and environment to improve access and quality of services

3) **Partnerships, Gender and Equity**: Foster partnerships and coordination for national health development; Strengthen the control of HIV/AIDS and Tuberculosis

The momentum created by the first CCS in the shift in the general direction of WHO action at the country level will be continued, moving WHO action from the operational to the strategic level, brokering action in the health sector rather than implementing. In implementing the strategic agenda, WHO will collaborate with all stakeholders in complementary and synergistic ways, ensuring that there will be no duplication and wastage of resources. Each of the three levels of the Organisation will be involved in the implementation of this agenda. The CCS will be monitored through routine WHO mechanisms: Semi-annual monitoring; Biennial reports.
