HIV found in COVID-19 vaccines

CONTEXT: Regional and International tweets circulated this past week to engage African users in discussions around COVID-19 vaccine ingredients.

Engagement: 2 posts, 2804 likes, 1908 retweets

Nigeria	a
	A <u>tweet</u> shared by <u>DR. Kek</u> , a Twitter account with a substantial following of
	104.3k users, garnered significant attention via retweets by multiple individuals
	in Nigeria.
	DR. Kek's account is known for actively participating in discussions related to
	<u>conspiracy theories</u> .
	The tweet reads: "Nobel Prize winner found dead after exposing HIV in the
	COVID Vaccines".
	The tweet made references to Luc Montagnier, a French virologist and joint
	recipient of the 2008 Nobel Prize in Medicine for his discovery of the human
	immunodeficiency virus in 1983. He said in the video: "there was "a
	manipulation done on the COVID-19 virus [] but on this model someone added
	on top of that some sequences including HIV, the virus for AIDS." Montagnier's
	conclusions were rejected by the <u>scientific community</u> .
South	Africa
	Similarly, a study titled "HIV-Infected Green Monkey DNA Found in COVID-19
	Vaccines" has been retweeted by a <u>user</u> in South Africa, and shared by multiple
	users globally that engage with discussions around conspiracy theories. [LINK,
	<u>LINK, LINK]</u>
	The study was shared by " <u>The People's Voice TV</u> ", a South African media
	platform founded by David Icke, a prominent conspiracy theorist and
	anti-vaccine advocate. The platform gained attention for promoting controversial
	and unscientific views since 2013, including spreading misinformation about
	vaccines and promoting conspiracy theories related to various global events.
	It's noteworthy that a "fact-checked" icon in the article has been included in an

attempt to verify its credibility to the audience.

Why i	s it concerning?
	International anti-vaxxers and conspiracy theorists have the ability to influence
	African media users by employing tactics that aim to enhance their credibility.
	That includes sharing claims that reference scientific and accredited figures,
	along with the use of "fact-checked" icons that have been increasingly accepted
	as a form of validation against misinformation.
	COVID-19 conspiracy theories are still a point of interest for many online users
	even following the declaration of the end of the emergency phase of the
	pandemic. Anti-vaxxers might have used this opportunity as a fertile ground to
	push for the emergence and dissemination of misinformation.
	COVID-19 conspiracy theories might offer simplified explanations or present
	alternative narratives that appeal to people seeking answers related to
	COVID-19 adverse reactions or deaths related to inoculation.
What	can we do?
	Amplify fact-checked articles by credible sources. A recent <u>article</u> by AP Fact
	check found no evidence to support the claim that the COVID-19 vaccines
	contain monkey DNA.
	Continue to promote VFA content, including COVID-19 videos on vaccine safety
	and approval [<u>ENG</u> , <u>FR</u>]
	Regularly monitoring websites from official sources including pharmaceutical
	companies to seek up-to-date <u>information</u> about vaccine production and
	ingredients.
Pers	istent trends
Conv	versations about cholera outbreaks
South	Africa
Fear g	rasps residents in regions outside of cholera epicenter
	In a recent YouTube <u>video</u> released by SABC News (South African Broadcasting
	Network) on June 14th, a growing concern was discussed among residents of
	Ha-Mutsha, a village situated roughly 150 km from Musina town near the
	border of Zimbabwe.
	The video shed light on their apprehensions regarding the potential escalation
	of cholera transmission due to the lack of access to safe water sources in their
	community. The residents' displayed sentiments of fear and worry amidst the
	ongoing cholera outbreak.

Blame to local authorities

☐ A TikTok <u>video</u> posted by Renaldogouws, a private user, gained significant attention from his 379k followers.

☐ Many online users amplified their lack of trust towards local authorities. These comments reflect the continuous frustrations of online users shared across multiple platforms. Below are some comments:

they are all blind, all they see is "celebrity" a president. They don't see the failure and corruption.

After seeing this video you have to ask yourself are there any hope for us as South Africans.

These people are excited for false promises, as always •

I was in disbelief also how can they dance and be happy while they lost their fellow neighbours

Democratic Republic of Congo

According to an <u>article</u> posted by Radio Okapi, a radio network based in the
Democratic Republic of the Congo, twenty deaths related to cholera have been
recorded since April 2023 as a result of the cholera epidemic in three health
zones in the city of Bukavu, in the province of South Kivu.

☐ Almost two hundred additional cases have been recorded every week for the past two months at the cholera treatment center at Bukavu's general referral hospital, according to medical sources cited in the article.

☐ The lack of access to drinking water is one of the causes of this epidemic according to Dr. Guy Mulinganya, the medical director of the Bukavu provincial general hospital, which houses the cholera treatment center. The slackening of hygiene measures against Covid has also exacerbated the situation, with barrier measures no longer respected by the population. He also added that preventive measures against COVID-19 and Ebola have been relaxed lately, and with this "an upsurge of cholera cases has been noted".

☐ It's noteworthy that community members have brought in some patients to seek care at the cholera treatment center, but have succumbed to the disease before receiving medical care.

According to the local infodemic management team in the DRC, the problem
is attributed to a lack of information within the community, some of whom
are unaware of the criteria for defining cases of cholera in the commune,
making it difficult to recognize the disease in time and take the appropriate
action.

Trend to watch

Dengue outbreak in Mauritius

Enga

ing	igue outbreak in Mauritius	
jag	gement: 11 posts, 2.5k likes, 320 comments	
	After the <u>detection</u> of dengue cases in Mauritius, the news was widely	
	disseminated by multiple local news media outlets. However, the level of	[:] public
	engagement, as reflected in the number of comments, remained relatively	y low.
	One fact that may have contributed to this is the <u>low internet penetration</u>	among
	the population in Mauritius.	
	On a Facebook <u>post</u> by "L'Express Maurice," a prominent French-languag	e daily
	newspaper in Mauritius with 887k followers, commentators expressed th	eir
	requests and expectations regarding lockdown announcements. Addition	ally,
	they called on the authorities to provide mosquito nets to high-risk location	ons
	and schools.	
	Notably, one commentator specifically inquired about the recommendatio	ns of
	the World Health Organization regarding the situation. Below are comme	ents,
	some of which were translated from french:	
	Give leave everywhere and prevent grouping.	
	C'est dingue. I would like to know what are the recommendations of the W.H.O	
	Put lockdown please	
	Confinement 😂	
	According to WHO's <u>fact sheet</u> on dengue and severe dengue fever, deng	gue is a
	viral infection caused by the dengue virus, transmitted to humans through	n the
	bite of infected mosquitoes. To prevent dengue, it is crucial to focus on	
	prevention and control measures, such as using mosquito nets, applying	
	repellents, and wearing protective clothing that covers the body.	
	Due to the COVID-19 pandemic, confinement measures aimed at contain	ing the
	spread of the pandemic have been at the forefront of people's minds.	
	Consequently, the awareness and implementation of accurate preventive	
	measures for dengue may have inadvertently been overlooked.

Methodology

The social media listening process relies on a combination of social media analyses conducted for French, English, and Lusophone-speaking countries.

The social media analysis for French-speaking countries is conducted by the AIRA Infodemic Manager Consultant based in Guinea, the one for Lusophone-speaking countries by the AIRA Infodemic Manager Consultant based in Angola, and the one for English-speaking countries by a WHO AFRO social media officer.

The final report is a combination of the three analyses and recommendations.

The shift from a social media listening monitoring conducted by only one person for the whole African region into a combined one based on the analysis conducted by three different people may result in a less detailed and exhaustive report.

Engagements, otherwise known as interactions, refer to the number of likes, comments, reactions, and re-shares on a post.

This is not a perfect measure of engagement:

- Some may have seen the post and chosen not to interact with it;
- Commenting on or re-sharing a post may constitute a more meaningful form of engagement than simply reacting to it;
- We are not systematically distinguishing between the types of responses that each engagement generates (e.g. while a post may contain misinformation, people may be countering/ debunking it in the comments).

We seek to mitigate these limitations by:

- Scanning comments and monitoring reactions to qualitatively evaluate responses to each post;
- Assessing the velocity of a post (i.e. how fast is it obtaining reactions, likes, and shares) and the re-emergence of specific themes;
- Identifying whether the post is shared across a variety of platforms and sources (broad engagement), or simply soliciting a high level of attention within a given community/ platform (siloed engagement).

The monitoring reports are produced using NewsWhip Analytics, Crowdtangle, Google Trends, and UNICEF Talkwalker dashboards as well as the WHO EPI-WIN weekly infodemic insight reports and the WHO EARS platform.

As a result, data may be biased towards data emerging from formal news outlets/ official social media pages and does not incorporate content circulating on closed platforms (e.g. Whatsapp) or groups (e.g. private Facebook groups).

We also rely on our fact-checking partners, who provide invaluable insights into relevant national and regional trends or content, as well as country-level reports, including the South Africa Social Listening Weekly Report and the Mali Social Listening Weekly Report.

In producing these summaries and recommendations, we have consulted community feedback survey reports, as well as monitoring and recommendations from AIRA partners. We also draw from WHO EPI-WIN weekly reports and UNICEF monthly reports to formulate recommendations. As we produce more content, we seek to triangulate and corroborate information across these groups to strengthen our infodemic response.
